UNITED STATES FIRST · UNITED KINGDOM READY

Automated Vehicle Recovery Desk

Who pays when a driverless car crashes, and can the insurer get it back?

Jayen · Antonio · Vakhtang · Triage evidence, not legal advice. Synthetic data.

WHY IT IS NEEDED

Few claims, high stakes, hidden proof

Few, high-stakes

88% fewer property and 92% fewer injury claims. The rest are contested.

The proof is theirs

Logs sit with the operator. Insurers must request or compel them.

A real market

$27bn of US subrogation demands in 2025. Firms keep 15–33%.

Two costly mistakes: chasing a losing claim, and missing a winning one.

Sources: Swiss Re and Waymo study (25.3 million miles); Arbitration Forums 2025 (all auto claims).

TARGET MARKET

Sold across the liability chain

Who buys it

Fleet insurers and reinsurers

Robotaxi operators, for defence and incident review

Fleet managing general agents

$27bn

US subrogation demands, 2025 (all auto)

about $7.7M

Driverless-only market by 2030 (range $1.4M–$45M)

15–20×

More driver-assist than driverless claims today

Source: market/MARKET.md. The 2030 sizing and the volume ratio use stated assumptions.

WHERE WE START

Why start in the United States

Waymo: driverless

500,000 paid rides a week

200 million driverless miles a year

Tesla: driver-assist

8 billion supervised miles (Tesla's figure)

Volume for screening; the driver is mostly liable

The data it gives us

Public federal crash reports

Our simulator reproduces 88% of real crashes

United Kingdom next: ready for the Automated Vehicles Act 2024 regime, expected late 2027.

Sources: market/MARKET.md; eval/REAL_CRASH_EVAL.md (100-Car study, public domain).

HOW A CLAIM RUNS

One claim, start to finish

1. Intake
Logs and video, integrity checked

→

2. Liability
Who was in control

→

3. Simulate
Would a careful driver avoid it?

→

4. Price
Recoverable range

→

5. Outcome
Next steps and deadline

→

6. Sign-off
A named human approves

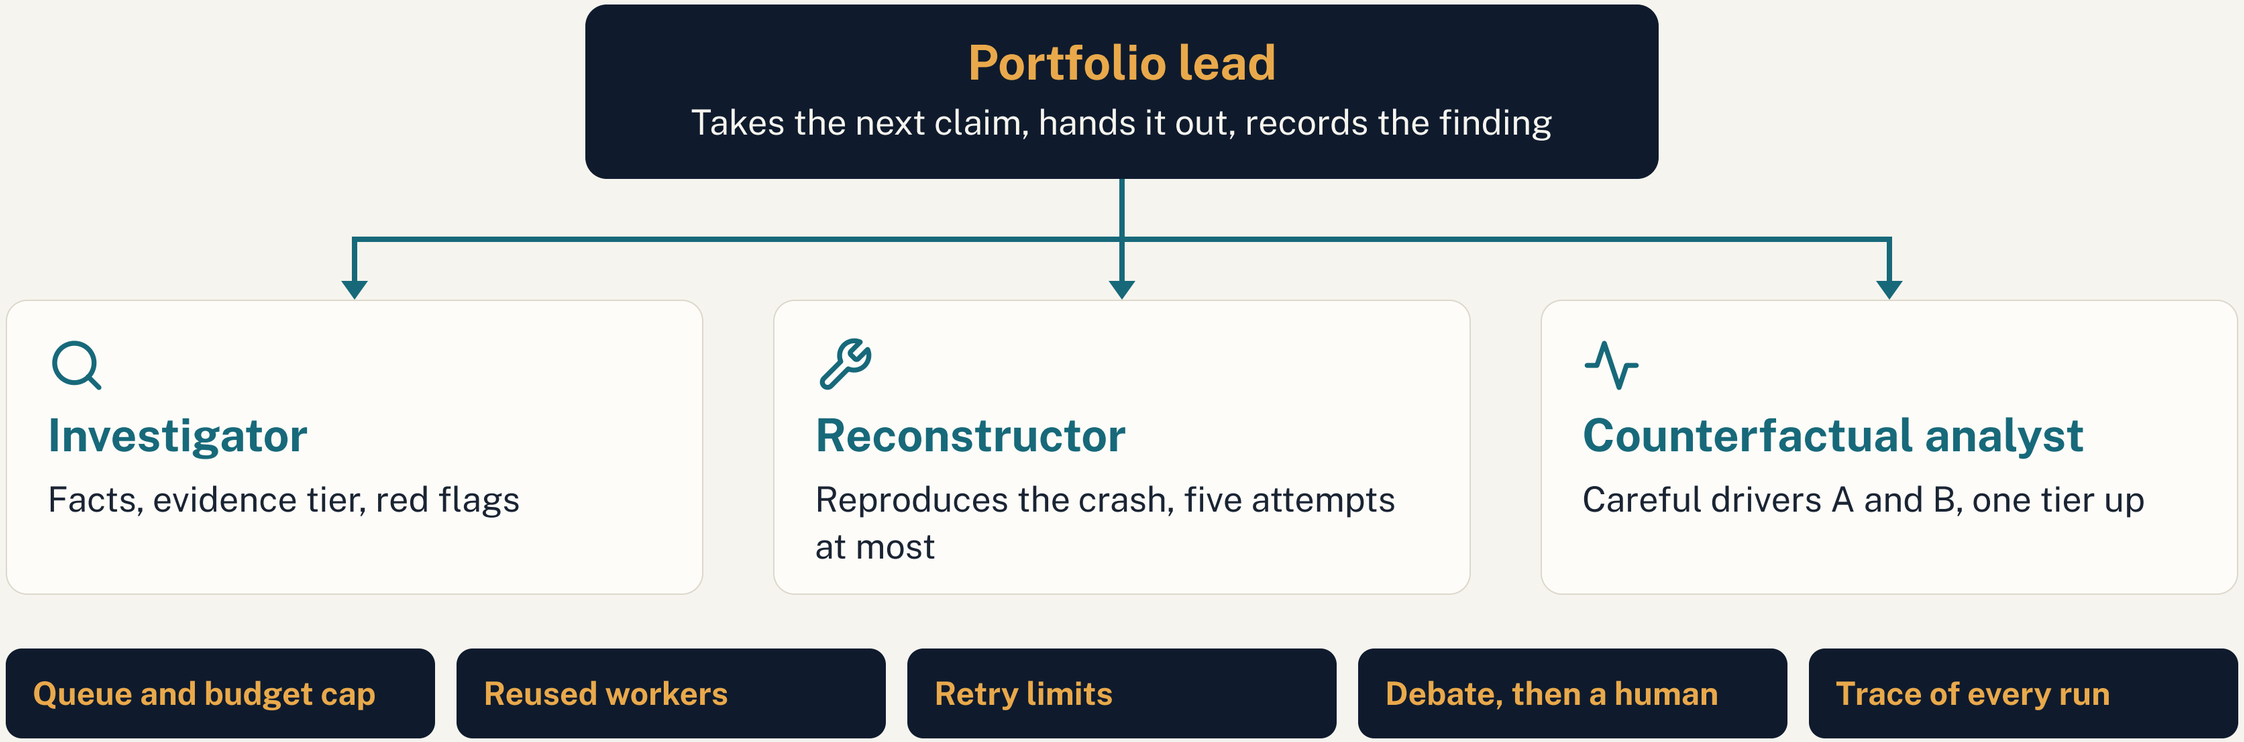

Then it loops: new evidence re-runs the claim; a ledger shows what changed.

Code produces every number. The agents only challenge it.

Every claim ends in one of eight outcomes, from pursue to close.

THE AGENT TEAM

Four agents, built to run for hours

Agents never produce numbers; the finance engine does.

Cue the demo

1. The claims inbox
2. One claim, start to finish
3. The agent run
4. The debate

accel-claims-dashboard.vercel.app

About two minutes. Synthetic claims.

BUSINESS CASE

Three ways to charge, margins that hold

Per claim

£300

Per driverless claim; £75 for a driver-assist screen. For pilots.

Success fee

10%

Of money recovered. Recovery firms keep 15–33%.

Subscription

£40k–£80k

A year, for operators and insurers. The one that scales.

$0.27 of AI compute per claim (measured)

87–90% gross margin · £2M seed

Prices, margin and seed are assumptions in market/MARKET.md; compute cost is measured.

RISKS

Risks, and how we address each

⚠ Small market before 2030	US first, subscriptions, driver-assist volume
⚠ Engine models UK law today	Build the US legal and cost model with counsel
⚠ The operator holds the evidence	Preservation letter, then a disclosure request
⚠ Models are guidance, not law	Quote drivers A and B together; a human signs off
⚠ Misuse against a victim	Victims are paid first; outputs are triage, not verdicts

Built in: ranges not points · refuses to guess · humans decide · integrity gate · audit trail

WHERE WE ARE, AND THE ASK

Ready for real claims

Working now

- 22 crashes, all reproduced
- Agents and live dashboard
- Over 200 tests

Not yet

- Real crash data
- US legal and cost model
- A tested price

The ask

£2M seed

A US pilot with one insurer or operator

One US counsel
