DRIVERLESS-VEHICLE LIABILITY · UNITED STATES FIRST, UNITED KINGDOM READY

Automated Vehicle Recovery Desk

When a driverless car crashes, who pays, and can the insurer get the money back?

A fast, auditable first read on every crash: what happened, what is recoverable, what to do next.

Jayen · Antonio · Vakhtang · Triage evidence for a claims handler, not legal advice. Synthetic data.

WHY IT IS NEEDED

Few claims, high stakes, hidden proof

Few, but high-stakes

88% fewer property and 92% fewer injury claims than human drivers. The few left are contested.

The proof is theirs

Driving logs sit with the operator. The insurer must request or compel them before it can judge a claim.

Recovery is a real market

About $27bn of US subrogation demands in 2025. Recovery firms keep 15% to 33%.

Two expensive mistakes: chasing a claim that fails, and missing one that would succeed. A fast, evidenced first read prevents both.

TARGET MARKET

Sold across the liability chain

Who buys it

Insurers of driverless fleets, and their reinsurers

Operators such as robotaxi companies, for defence and incident review

Fleet managing general agents

Day to day: claims handlers, recoveries counsel, and managers who sign off spend

$27bn

US subrogation demands, 2025 (all auto)

about $7.7M

Driverless-only market by 2030 (range $1.4M to $45M)

15–20×

More driver-assist than driverless claims today

Source: market/MARKET.md (43 sources; the 2030 sizing and the volume ratio use stated assumptions). Automated Vehicle Recovery Desk

WHERE WE START

Why start in the United States

Waymo: driverless

500,000 paid rides a week, in 10 cities

About 200 million driverless miles a year

The real driverless claims

Tesla: driver-assist

8 billion supervised-driving miles (Tesla’s own figure)

Volume for screening; liability sits mostly with the driver

The data it gives us

Public federal crash reports (the regulator says they may be incomplete)

Our simulator reproduces 88% of real crashes in a public study

United Kingdom next: no vehicle is on the government’s self-driving list today. We are ready for the Automated Vehicles Act 2024 regime, expected late 2027.

Sources: market/MARKET.md (operator figures; Tesla’s are its own); eval/REAL_CRASH_EVAL.md (100-Car study, public domain). Automated Vehicle Recovery Desk

A CLAIM, START TO FINISH

One claim, start to finish

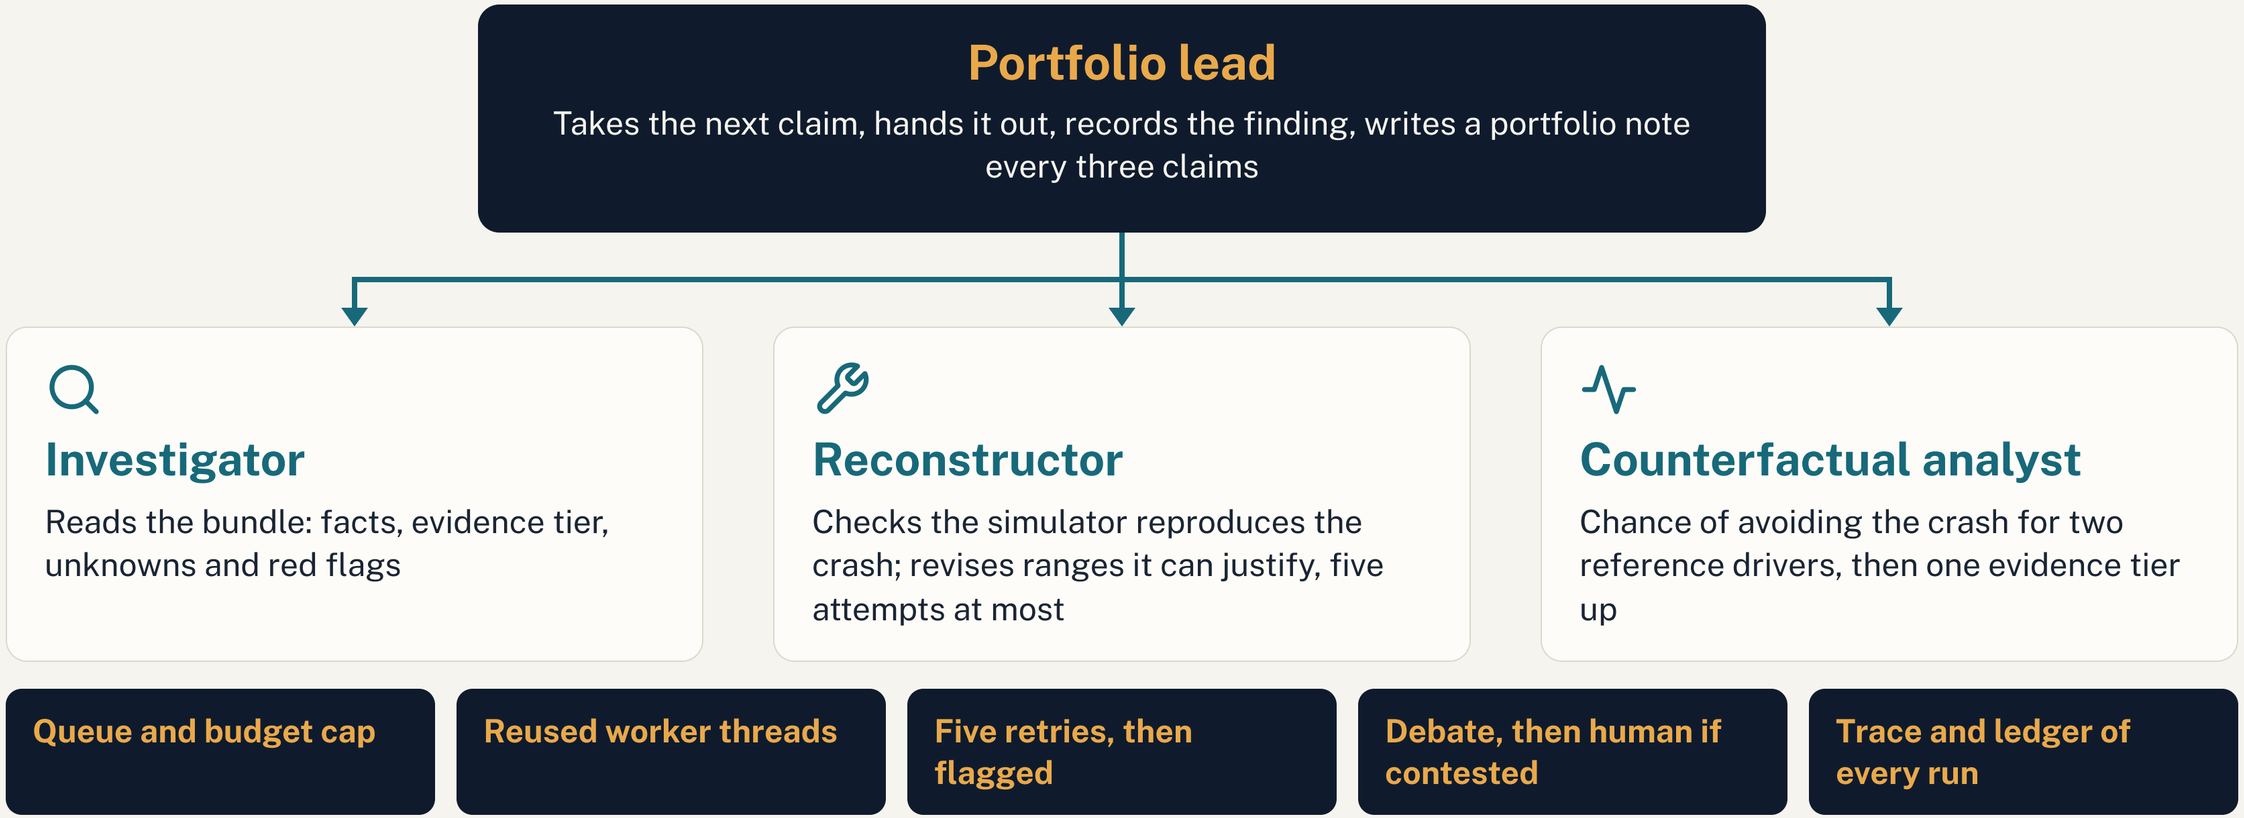

Then it loops: when new evidence arrives, the claim re-runs and a ledger shows what changed. The limitation deadline stays first on the list.

Deterministic code produces every number. The agents only challenge it.

The eight outcomes: pursue, pull logs, needs inputs, human review, settle without recovery, recover from insured, motor claim, close. Automated Vehicle Recovery Desk

THE AGENT TEAM, BUILT FOR LONG RUNS

Four agents, built to run for hours

Debate: adjuster prices, defence counsel attacks, adjuster rebuts; the finance engine recomputes every number. Automated Vehicle Recovery Desk

LIVE DEMO

One claim, three numbers, one outcome

99–100%

Chance of avoiding the crash

A careful driver would have avoided it (two reference models)

99–100%

Automated vehicle's share of fault

After the injured party's own share, if any

£8.9k to £51.2k

Expected recovery

On a £60k paid claim, after legal cost

Outcome: pursue. Send a letter before action, preserve the logs, mind the deadline. Then: the claims inbox, an evidence-gated claim, the agent run and the debate.

Example 21, a synthetic cut-in crash. Costs: UK court rules (worked example). Dashboard: accel-claims-dashboard.vercel.app

BUSINESS CASE · HOW WE CHARGE

Three ways to charge, margins that hold

Per claim

Deep analysis of a driverless claim.

£300 (about $400)

Driver-assist screening: £75

Best for: occasional or pilot customers

Success fee

A share of what is recovered, below the 15% to 33% recovery firms keep.

10% of recovery

Best for: insurers who want aligned incentives. Money arrives years later

Platform subscription

Trace, evidence packs and a recoverability map. Operators use it for defence too.

£40k to £80k a year

Best for: operators, insurers and managing general agents. The scalable one

$0.27 of AI compute per claim, measured, including the debate. Human review is about 99% of cost.

About 87% to 90% gross margin. Plan: £240k revenue in 2027, £2.22M in 2029, on a £2M seed.

Prices, review cost and the plan are assumptions in market/MARKET.md ($1.33 to £1 assumed); compute cost is measured. Automated Vehicle Recovery Desk

RISKS AND HOW WE ADDRESS THEM

Risks, and how we address each

⚠ The driverless-only market is small before 2030	→ United States first; subscriptions across the chain; driver-assist screening for volume
⚠ Our engine models UK law, not yet United States law	→ Build a United States legal and cost model with counsel; the liability test and simulator carry over
⚠ The operator or manufacturer holds the evidence	→ Preservation letter, then a court disclosure request; show what better evidence would change
⚠ The reference models are guidance, not law	→ Always quote careful drivers A and B together; flag “model-dependent”; a human signs off
⚠ A triage number misused to deny or pressure a victim	→ Victims are paid before any recovery decision; outputs are triage evidence, never a liability finding

Built in: ranges not points · refuses to guess · humans decide · evidence integrity gate · audit trail · synthetic data only

WHERE WE ARE, AND THE ASK

A working answer, ready for real claims

Working now

- 22 example crashes, all reproduced by the simulator
- Two agent systems, live dashboard, one-command run
- Deadline clocks, audit ledger, over 200 tests

Not yet

- All crash data is synthetic
- No United States legal or cost model yet
- No real insurer data and no price test

The ask

A £2M seed

One insurer or operator for a United States pilot on settled claims

One United States counsel to shape the cost model
